

FEATURES

- Industrial temperature range (–40°C to +85°C)
- 3.3V power supply
- SONET/SDH/ATM compatible
- Clock and data recovery from 32Mbps up to 175Mbps NRZ data stream, clock generation from 32Mbps to 175Mbps
- Two on-chip PLLs: one for clock generation and another for clock recovery
- Selectable reference frequencies
- Differential PECL high-speed serial I/O
- Line receiver input: no external buffering needed
- Link Fault indication
- 100K ECL compatible I/O
- Complies with Bellcore, ITU/CCITT and ANSI specifications for applications such as OC-1 and OC-3 as well as proprietary applications
- Available in 32-pin EPAD-TQFP and 28-pin SOIC packages

DESCRIPTION

The SY87700L is a complete Clock Recovery and Data Retiming integrated circuit for data rates from 32Mbps up to 175Mbps NRZ. The device is ideally suited for SONET/SDH/ATM applications and other high-speed data transmission systems.

Clock recovery and data retiming is performed by synchronizing the on-chip VCO directly to the incoming data stream. The VCO center frequency is controlled by the reference clock frequency and the selected divide ratio. On-chip clock generation is performed through the use of a frequency multiplier PLL with a byte rate source as reference.

The SY87700L also includes a link fault detection circuit.

APPLICATIONS

- SONET/SDH/ATM OC-1 and OC-3
- Fast Ethernet, SMPTE 259
- Proprietary architecture up to 175Mbps

BLOCK DIAGRAM

PIN CONFIGURATION

PIN DESCRIPTIONS

INPUTS

RDINP, RDINN [Serial Data Input] Differential PECL

These built-in line receiver inputs are connected to the differential receive serial data stream. An internal receive PLL recovers the embedded clock (RCLK) and data (RDOUT) information. The incoming data rate can be within one of five frequency ranges depending on the state of the FREQSEL pins. See “Frequency Selection” Table.

REFCLK [Reference Clock] TTL inputs

This input is used as the reference for the internal frequency synthesizer and the "training" frequency for the receiver PLL to keep it centered in the absence of data coming in on the RDIN inputs.

CD [Carrier Detect] PECL Input

This input controls the recovery function of the Receive PLL and can be driven by the carrier detect output of optical modules or from external transition detection circuitry. When this input is HIGH the input data stream (RDIN) is recovered normally by the Receive PLL. When this input is LOW the data on the inputs RDIN will be internally forced to a constant LOW, the data outputs RDOUT will remain LOW, the Link Fault Indicator output LFIN forced LOW and the clock recovery PLL forced to look onto the clock frequency generated from REFCLK.

FREQSEL1, ..., FREQSEL3 [Frequency Select] TTL Inputs

These inputs select the output clock frequency range as shown in the “Frequency Selection” Table.

DIVSEL1, DIVSEL2 [Divider Select] TTL Inputs

These inputs select the ratio between the output clock frequency (RCLK/TCLK) and the REFCLK input frequency as shown in the “Reference Frequency Selection” Table.

CLKSEL [Clock Select] TTL Inputs

This input is used to select either the recovered clock of the receiver PLL (CLKSEL = HIGH) or the clock of the frequency synthesizer (CLKSEL = LOW) to the TCLK outputs.

OUTPUTS

LFIN [Link Fault Indicator] TTL Output

This output indicates the status of the input data stream RDIN. Active HIGH signal is indicating when the internal clock recovery PLL has locked onto the incoming data stream. LFIN will go HIGH if CD is HIGH and RDIN is within the frequency range of the Receive PLL (1000ppm). LFIN is an asynchronous output.

RDOUTP, RDOUTN [Receive Data Output] Differential PECL

These ECL 100K outputs represent the recovered data from the input data stream (RDIN). This recovered data is specified against the rising edge of RCLK.

RCLKP, RCLKN [Clock Output] Differential PECL

These ECL 100K outputs represent the recovered clock used to sample the recovered data (RDOU).

TCLKP, TCLKN [Clock Output] Differential PECL

These ECL 100K outputs represent either the recovered clock (CLKSEL = HIGH) used to sample the recovered data (RDOU) or the transmit clock of the frequency synthesizer (CLKSEL = LOW).

PLLSP, PLLSN [Clock Synthesis PLL Loop Filter]

External loop filter pins for the clock synthesis PLL.

PLLRP, PLLRN [Clock Recovery PLL Loop Filter]

External loop filter pins for the receiver PLL.

POWER & GROUND

VCC	Supply Voltage ⁽¹⁾
VCCA	Analog Supply Voltage ⁽¹⁾
VCCO	Output Supply Voltage ⁽¹⁾
GND	Ground
N/C	No Connect

NOTE:

1. VCC, VCCA, VCCO must be the same value.

FUNCTIONAL DESCRIPTION**Clock Recovery**

Clock Recovery, as shown in the block diagram generates a clock that is at the same frequency as the incoming data bit rate at the Serial Data input. The clock is phase aligned by a PLL so that it samples the data in the center of the data eye pattern.

The phase relationship between the edge transitions of the data and those of the generated clock are compared by a phase/frequency detector. Output pulses from the detector indicate the required direction of phase correction. These pulses are smoothed by an integral loop filter. The output of the loop filter controls the frequency of the Voltage Controlled Oscillator (VCO), which generates the recovered clock.

Frequency stability without incoming data is guaranteed by an alternate reference input (REFCLK) that the PLL locks onto when data is lost. If the Frequency of the incoming signal varies by greater than approximately 1000ppm with respect to the synthesizer frequency, the PLL will be declared out of lock, and the PLL will lock to the reference clock.

The loop filter transfer function is optimized to enable the PLL to track the jitter, yet tolerate the minimum transition density expected in a received SONET data signal. This transfer function yields a 30 μ s data stream of continuous 1's or 0's for random incoming NRZ data.

The total loop dynamics of the clock recovery PLL provides jitter tolerance which is better than the specified tolerance in GR-253-CORE.

Lock Detect

The SY87700L contains a link fault indication circuit which monitors the integrity of the serial data inputs. If the received serial data fails the frequency test, the PLL will be forced to lock to the local reference clock. This will maintain the correct frequency of the recovered clock output under loss of signal or loss of lock conditions. If the recovered clock frequency deviates from the local reference clock frequency by more than approximately 1000ppm, the PLL will be declared out of lock. The lock detect circuit will poll the input data stream in an attempt to reacquire lock to data. If the recovered clock frequency is determined to be within approximately 1000ppm, the PLL will be declared in lock and the lock detect output will go active.

CHARACTERISTICS

Performance

The SY87700L PLL complies with the jitter specifications proposed for SONET/SDH equipment defined by the Bellcore Specifications: GR-253-CORE, Issue 2, December 1995 and ITU-T Recommendations: G.958 document, when used with differential inputs and outputs.

Input Jitter Tolerance

Input jitter tolerance is defined as the peak-to-peak amplitude of sinusoidal jitter applied on the input signal that causes an equivalent 1dB optical/electrical power penalty. SONET input jitter tolerance requirement condition is the input jitter amplitude which causes an equivalent of 1dB power penalty.

Jitter Transfer

Jitter transfer function is defined as the ratio of jitter on the output OC-N/STS-N signal to the jitter applied on the input OC-N/STS-N signal versus frequency. Jitter transfer requirements are shown in Figure 2.

Jitter Generation

The jitter of the serial clock and serial data outputs shall not exceed .01 U.I. rms when a serial data input with no jitter is presented to the serial data inputs.

OC/STS-N Level	f0 (Hz)	f1 (Hz)	f2 (Hz)	f3 (kHz)	ft (kHz)
3	10	30	300	6.5	65

Figure 1. Input Jitter Tolerance

OC/STS-N Level	fc (kHz)	P (dB)
3	130	0.1

FREQUENCY SELECTION TABLE

FREQSEL1	FREQSEL2	FREQSEL3	fvco/frCLK	frCLK Data Rates (Mbps)
0	1	1	6	125 – 175
1	0	0	8	94 – 157
1	0	1	12	63 – 104
1	1	0	16	47 – 78
1	1	1	24	32 – 52
0	1	0	—	undefined
0	0	X ⁽²⁾	—	undefined

NOTES:

1. SY87700L operates from 32-175MHz. For higher speed applications, the SY87701L operates from 32-1250MHz.
2. X is a DON'T CARE.

REFERENCE FREQUENCY SELECTION

DIVSEL1	DIVSEL2	frCLK/fREFCLK
0	0	8
0	1	10
1	0	16
1	1	20

LOOP FILTER COMPONENTS⁽¹⁾

SONET

R5 = 80Ω
C3 = 1.5μF (X7R Dielectric)

Wide Range

R5 = 350Ω
C3 = 0.47μF (X7R Dielectric)

SONET

R6 = 50Ω
C4 = 1.0μF (X7R Dielectric)

Wide Range

R6 = 680Ω
C4 = 0.47μF (X7R Dielectric)

NOTE:

1. Suggested Values. Values may vary for different applications.

ABSOLUTE MAXIMUM RATINGS⁽¹⁾

Symbol	Rating	Value	Unit
V_{CC}	Power Supply Voltage	-0.5 to +7.0	V
V_I	Input Voltage	-0.5 to V_{CC}	V
I_{OUT}	Output Current – Continuous – Surge	50 100	mA
T_{store}	Storage Temperature	-65 to +150	°C
T_A	Operating Temperature	-40 to +85	°C

NOTE:

1. Permanent device damage may occur if ABSOLUTE MAXIMUM RATINGS are exceeded. This is a stress rating only and functional operation is not implied at conditions other than those detailed in the operational sections of this data sheet. Exposure to ABSOLUTE MAXIMUM RATING conditions for extended periods may affect device reliability.

PACKAGE THERMAL DATA⁽¹⁾

θ_{JA} (°C/W) by Velocity (LFPM)

Package	0	200	500
28-Pin SOIC	80	—	—
32-Pin EP-TQFP ⁽²⁾	27.6	22.6	20.7

NOTES:

1. Airflow of 500lfpm recommended for 28-pin SOIC.
2. Using JEDEC standard test boards with die attach pad soldered to PCB. See www.amkor.com for additional package details.

28 LEAD SOIC .300" WIDE (Z28-1)

- NOTES:
1. DIMENSIONS ARE IN INCHES[MM].
 2. CONTROLLING DIMENSION: INCHES.
 - ⓐ DIMENSION DOES NOT INCLUDE MOLD FLASH OR PROTRUSIONS, EITHER OF WHICH SHALL NOT EXCEED 0.006[0.15] PER SIDE.
 4. MAXIMUM AND MINIMUM SPECIFICATIONS ARE INDICATED AS FOLLOWS: MAX
MIN

Rev. 02

Note:

The 28 Lead SOIC package is NOT recommended for new designs.

32 LEAD EPAD TQFP (DIE UP) (H32-1)

- NOTES:
1. DIMENSIONS ARE IN MM(INCHES).
 2. CONTROLLING DIMENSION: MM.
 3. DIMENSION DOES NOT INCLUDE MOLD FLASH OR PROTRUSIONS, EITHER OF WHICH SHALL NOT EXCEED 0.254 [0.010].
 4. LEAD DIMENSION DOES NOT INCLUDE DAMBAR PROTRUSION.
 5. MAXIMUM AND MINIMUM SPECIFICATIONS ARE INDICATED AS FOLLOWS: MAX/MIN. THESE DIMENSIONS TO BE DETERMINED AT DATUM PLANE [H].
 6. PACKAGE TOP DIMENSIONS ARE SMALLER THAN BOTTOM DIMENSIONS AND TOP OF PACKAGE WILL NOT OVERHANG BOTTOM OF PACKAGE.
 7. EXPOSED PAD SHALL BE COPLANAR WITH PACKAGE BOTTOM WITHIN 0.05mm.
 8. EXPOSED PAD: Cu WITH Sn/Pb PLATING.
 9. DIMENSION INCLUDES LEAD FINISH.

Rev. 01

PCB Thermal Consideration for 32-Pin EPAD-TQFP Package

APPENDIX A

Layout and General Suggestions

1. Establish controlled impedance stripline, microstrip, or co-planar construction techniques.
2. Signal paths should have, approximately, the same width as the device pads.
3. All differential paths are critical timing paths, where skew should be matched to within ± 10 ps.
4. Signal trace impedance should not vary more than $\pm 5\%$. If in doubt, perform TDR analysis of all high-speed signal traces.
5. Maintain compact filter networks as close to filter pins as possible. Provide ground plane relief under filter path to reduce stray capacitance. Be careful of crosstalk coupling into the filter network.
6. Maintain low jitter on the REFCLK input. Isolate the XTAL oscillator from power supply noise by adequately decoupling. Keep XTAL oscillator close to device, and minimize capacitive coupling from adjacent signals.
7. Higher speed operation may require use of fundamental-tone (third-overtone typically have more jitter) crystal based oscillator for optimum performance. Evaluate and compare candidates by measuring TXCLK jitter.
8. Evaluate ASIC AND FPGA REFIN source clocks with suitable jitter analysis equipment, such as TDS11801 tektronix DSO oscilloscope, or Wavecrest DTS2077 Time Interval Analyzer.
9. All unused outputs require termination.
